

JIMATJALAN — PITCH SCRIPT & Q&A

7 min pitch · 5 min Q&A · 2 presenters

Deck: jimatjalan.vercel.app/pitch.html (arrows/space to move · **S** = speaker notes). App: jimatjalan.vercel.app. **A** = Presenter A · **B** = Presenter B. 📱 = cue the judges' phones.

A SCRIPT · CHAPTERS 0-4 (~3:30)

0 · COLD OPEN (~30S)

"Your government gave you money. It's evaporating."

SAY Before I say anything — take out your phone, scan this QR. You're not watching a demo today, you're holding it.

📱 Wait ~10s for everyone to scan + land on the app.

1 · THE PROBLEM (~45S)

"BUDI95 made fuel a monthly allowance nobody tracks."

SAY Meet Aisyah — like most of us. BUDI95 turned RON95 into a monthly quota. She fills when the tank's empty, no idea how much subsidy she has or when prices move. The official app shows a balance — it never tells her what to *do*.

2 · THE VERDICT (~40S)

"Patut Isi? — Should I fill?"

SAY So we built the thing that just tells you. One tap. Go on — tap "Patut Isi?" on your phone right now.

📱 Judges tap the verdict. Pause for it.

3 · THE TWIST (~45S)

"Sometimes the smartest move is: don't fill up."

SAY And the answer surprises people — often, *don't* fill up. Bridge just enough to reach the reset, buy the rest subsidised after. It's the **money** that expires, not the fuel. On one tank, that's **RM58**.

4 · AI THAT CAN'T LIE (~50S)

"Code owns the numbers. The AI owns the voice."

SAY But can you trust a number from an AI? Ours **can't lie** — code computes and validates every ringgit; the AI only voices it. Then ask it anything real. On your phone, open **Ask** and type "drive to JB or take the bus?"

📱 Judges ask. Read one answer aloud: "RM85.96 in fuel — grounded, not guessed. A calculator can't do that."

↳ **HANDOFF:** A: "And it's more than timing — here's the whole picture." → hand the clicker to B.

B SCRIPT - CHAPTERS 5-8 (~3:30)

5 · FIVE SURFACES, ONE APP (~50S)

"Money first. Carbon honest."

SAY It's not one trick — it's one app that kills all four problems. A live **Prices** board and trend, an Efficiency Score with an **eco-coach** that tells you how to fix it — personal to each driver — and an honest spend forecast. Open **Prices**, then **Tank**.

📱 **Judges open Prices → Tank. "Tracking, analytics, prices, emissions — no longer five apps."**

6 · THE WEDGE (~50S)

"The e-hailing driver lives and dies by this."

SAY Who feels this most? The e-hailing driver — burns past the cap, every ringgit compounds. For Rahman we say: **bank** the subsidy before it expires, even with fuel in the tank — **RM70**. Switch to "Rahman" up top.

📱 **Judges flip the persona toggle. "Land this segment, then sell the fleet dashboard."**

7 · WHY WE WIN (~45S)

"Everyone else can't."

SAY Why can't Setel just copy us? A calculator can't reason over your state. A generic wallet doesn't model the quota or bridge-vs-bank. An LLM wrapper hallucinates. And BUDI95 changed twice in 2026 — our engine is **config, not premise**. We're a fuel-spend optimiser for *any* regime.

8 · THE CLOSE (~30S)

"Know when to fill up. Save more every week."

SAY You've been using the real, live product this whole time. Consumer today → fleet B2B → station and insurer partnerships. JimatJalan — the fuel financial-advisor in every Malaysian's pocket. Thank you — questions?

A Q&A - TECHNICAL

A fields technical fire. Lead bold line; green = mic-drop.

Q How do you know my quota?

It's an **estimate**, anchored at onboarding from the BUDI95 app/receipt, projected by logged fills. **Missed a fill? One tap "Correct balance" re-anchors** — drift never poisons the verdict.

Q What after the quota's gone?

Float Regime — same engine, weekly Wednesday price clock; bridge to the next known reprice. **We surface the known date, never predict the price.**

Q Isn't the AI just formatting a calculator?

Code computes & validates every number; the AI only voices it. The non-calculator part is **Ask JimatJalan** — reasoning over your real state ("JB?" → RM85.96).

Q Where's prediction / price monitoring?

Prices tab = live board + 8-week trend. **We predict your spend, not the price** — RM119 next month from your burn. **Predicting the price would be a lie.**

Q How is "save RM58" real?

vs filling the **whole tank at today's price** — deferred market litres × the RM2.08 subsidy gap. We show the subsidised+market split — auditable.

Q How do you know it's "hard acceleration"?

We don't assert it — code ranks a **bounded cause menu** by driver type + trip length, labelled "likely culprits". **Inference, honestly framed — never "we measured you".**

Q Accessibility?

Focus rings, AA contrast, ≥48px tap targets, colour never the only signal, reduced-motion, semantic headings — installable PWA.

Q What if AI / wifi dies on stage?

It can't go blank. Every surface falls back to a deterministic, number-exact voice. **The decision is code; only the wording needs the model.**

B Q&A · BUSINESS

B fields business fire.

Q What's the moat? Anyone can build this.

Not the formula — the **segment-tuned model** (Quota Cap 200/800, bridge-vs-bank) generic wallets lack, plus **per-driver data** (baseline + cadence → switching cost) feeding a **B2B fleet** play. And the can't-lie guard is trust a wrapper can't claim.

Q Won't Setel / TnG / Maybank bundle it free?

Distribution beats features only on the **mass consumer**. We win the **high-pain e-hailing wedge + fleet B2B** — segments their generic wallets don't model.

Q BUDI95 could change or vanish.

It **changed twice in 2026**. The two-clock engine is **config, not premise** — a policy change is an edit. **We're a fuel-spend optimiser for any regime**; BUDI95 is today's instance.

Q Revenue & financial sustainability?

Freemium (premium analytics) · **B2B fleet** (per-driver/mo + sustainability reporting) · **partnerships** (stations, insurers). **Marginal cost ≈ a fraction-of-a-sen LLM call; most value served at zero AI cost.**

Q Market size & demand?

National RON95 base; wedge = large, high-spend, high-churn **e-hailing/gig**. **Why now: the quota model is brand-new and volatile.** (*Drop in verified driver/spend figures.*)

Q Scalability?

Config-driven engine (new segment = data), swappable Store adapter (→ Postgres), cheap unit economics, degrades to zero-cost deterministic under load.

If cornered (either presenter): ① It's an estimate, re-anchorable. ② Code owns the numbers, AI owns the voice — it can't lie. ③ Config, not premise — survives any policy.
